Mechanical Systems Work

Integrated Design Capability / Instrument Design Laboratory

- Using the design from GOCECP as a baseline template
- Three Main Assemblies
 - Scan Drum And Assembly Mechanism—Telescope, optics, and mechanism that spins the telescope
 - Aft Optics/Detector Assembly—Detectors, Fiber Optics
 - Cradle Assembly—Tilting Mechanism, calibrating mechanism, I/F to Spacecraft
- Main structural Materials used
 - Al 6061-T6
 - Aluminum Honeycomb

Instrument Packaging Overview

Integrated Design Capability / Instrument Design Laboratory

Scan Drum and Mechanism Assembly

Integrated Design Capability / Instrument Design Laboratory

Scanning Telescope Assembly

Integrated Design Capability / Instrument Design Laboratory

Aft Optics/Detector Assembly

Integrated Design Capability / Instrument Design Laboratory

Detector Array Assembly

Integrated Design Capability / Instrument Design Laboratory

Trade to Add Third Brace

Integrated Design Capability / Instrument Design Laboratory

- Used FEA to compare advantages of 2 vs 3 braces holding the Detector Array Mounting Plate
 - Simple model using Bar and Plate Elements
 - Mass of Six Pack Assemblies modeled as non-structural mass

VS

FEA Results

Integrated Design Capability / Instrument Design Laboratory

- First mode for two braces 13Hz

First mode for three braces 21Hz

Side Support for Detector Array Structure Assembly

Integrated Design Capability / Instrument Design Laboratory

- First mode still low, add support by connecting to Aft Structure Side Panel
 - Increase First Mode to 41Hz which is likely acceptable (need structures blessing)
 - Might need to further increase stiffness

Attach Detector
Array Structure
Assembly to Aft
Structure Side Panel
Here

Preliminary FEA of Detector Array Structure Assembly

Integrated Design Capability / Instrument Design Laboratory

- Material: Al 6061-T6
- Allowable Assumed (yield): 32ksi
- FS: 1.25
- Max stress: 8.1ksi
- Margin of Safety: $(32)/(8.1 \times 1.25) - 1 = \underline{+2.16}$

Detector Six Pack

Integrated Design Capability / Instrument Design Laboratory

Note: Lens/Detector Assembly = Optics Tube Assembly + Detector Assembly

Lens/Detector Assembly

Integrated Design Capability / Instrument Design Laboratory

Based on ATLAS Design

Note: Material to be used for the Optics Tube and Detector Housing is baselined as Aluminum. Depending on temperature excursions of the assembly and optical alignment tolerances, it might be necessary to use Titanium instead.

ATLAS Optics Tube

Integrated Design Capability / Instrument Design Laboratory

Fiber Optic Routing

Integrated Design Capability / Instrument Design Laboratory

Fiber Support Plates have C-channels to route the Fiber optics. It guides them and maintains minimum bend radii

Cradle Assembly

Integrated Design Capability / Instrument Design Laboratory

Concerns

Integrated Design Capability / Instrument Design Laboratory

- **Alignment of Optics Tube components and Detector Assembly**
 - Labor intensive for 144 Assemblies if tolerances are tight and alignment needs to be done “by hand” (as opposed to using machine tolerances)
- **Routing of Fiber optics**
 - Difficult Assembly (routing)
 - Nested assembly would make it difficult to disassemble
- **Alignment of fiber bundle to HAM to Telescope**
- **Still Missing Addition of Radiators and Thermal hardware**
